

Experiment 24: Perform Sharpening of Image using High-Boost Mask

AIM

To sharpen an image using the High-Boost filtering technique.

PROCEDURE

1. Read the image.
2. Blur the image using Gaussian Blur.
3. Create the high-boost mask.
4. Add the mask to the original image.
5. Display the sharpened image.

PROGRAM

```
import cv2

# Read image
img = cv2.imread(r"C:\Users\chait\OneDrive\Documents\Desktop\cv lab image.jpg")

# Blur image
blur = cv2.GaussianBlur(img, (5,5), 0)

# High-Boost Sharpening
sharp = cv2.addWeighted(img, 2.0, blur, -1.0, 0)

cv2.imshow("Original Image", img)
cv2.imshow("High Boost Image", sharp)

cv2.waitKey(0)
cv2.destroyAllWindows()
```

OUTPUT

The sharpened image using the High-Boost mask is displayed.

Explanation

We blurred the image and combined it with the original image using High-Build filtering. This enhances image details while preserving the overall appearance.
